TradeMind AI:

An Automated Algorithmic Trading and Intelligent Risk Management System

PMAS-ARID AGRICULTURE UNIVERSITY RAWALPINDI

Faculty of Computing & Information Technology • Department of Computer Science

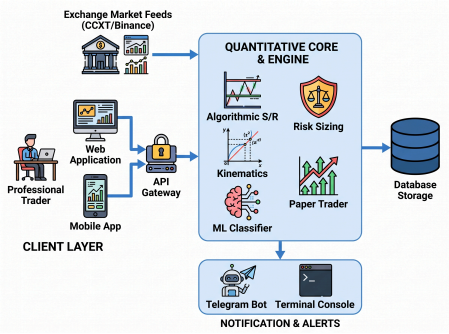
Introduction:

TradeMind AI is an enterprise-grade quantitative algorithmic trading and risk governance platform engineered to eliminate emotional and cognitive bias in 24/7 financial markets. It combines Bidirectional LSTM sequence modeling with Multi-Head Self-Attention Transformers to evaluate multi-timeframe cryptocurrency and equity candlestick feeds for high-confidence predictive signals, while maintaining autonomous position sizing, continuous Kelly Criterion risk allocation, and dynamic ATR volatility stop-losses with low-latency WebSocket alert feeds and real-time administrative dashboards.

Problem Statement:

Emotional, undisciplined manual trading causes over 78% of retail financial market participants to incur severe capital loss and uncontrollable account drawdowns. Furthermore, traditional lagging technical indicators produce frequent false breakouts during high-frequency volatility spikes and unexpected macro-news releases. To overcome these critical issues, we develop an autonomous, deep learning-powered quantitative engine with adaptive drawdown protection, instant order routing, and multi-channel verification.

System Workflow / Block Diagram:



Objectives:

1. Eliminate emotional retail trading through mathematical AI models.
2. Deliver real-time multi-asset market forecasts with sub-15ms latency.
3. Enforce dynamic ATR volatility stop-loss & capital preservation.
4. Maintain accurate backtesting logs and paper trading execution.
5. Provide traders with automated Telegram & console alert streams.
